Product Update

SUB-C200229

Form: 201611001

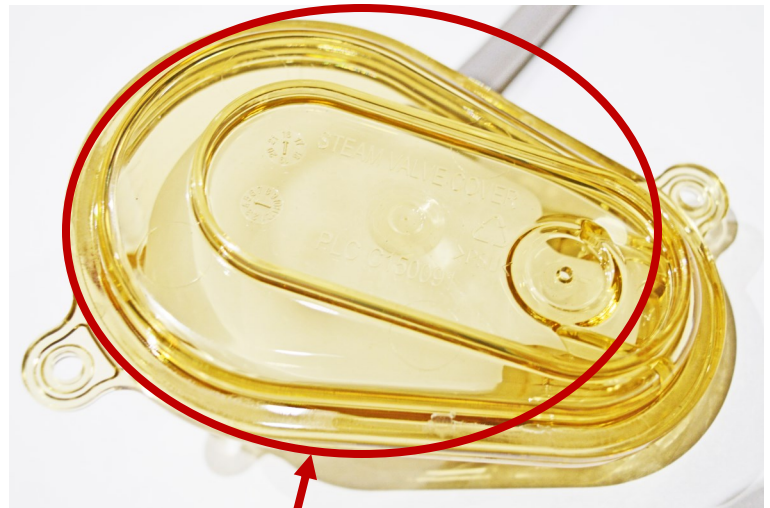

As part of our dedication to continuously improve our product, Crystal Mountain has changed the construction of the Steam Valve used in the Storm, bottom load, water cooler. Previously the steam valve had a circular, sealed float which was used to close the steam vent opening during usage. The circular float has been replaced with a “D” or oval shaped float which is bottomless. The previous float was the same clear, amber colored plastic as the steam valve body while the new design uses a white plastic float body.

All new production will use the updated steam valves once the older parts are used up by production. The same will hold true for spare parts. All orders will be fulfilled using the new parts once stock is depleted. A new part number will be utilized at that time.
